BIM && YOU | EP.02: 1-CLICK MODEL PREP

Batch-Hide Revit Links in 1 Click

Stop unchecking linked models 1 by 1 across every coordination view.

Youssef Adel
BIM COORDINATOR

01 // THE PROBLEM
Manual link toggling per view.

02 // THE SETUP
Dedicated 3D Navisworks view.

03 // THE EXECUTION
Zero-package Dynamo override.

04 // THE RESULT
1-second clean NWC export prep.

SWIPE FOR WORKFLOW →

PHASE 01 // THE COORDINATION BOTTLENECK

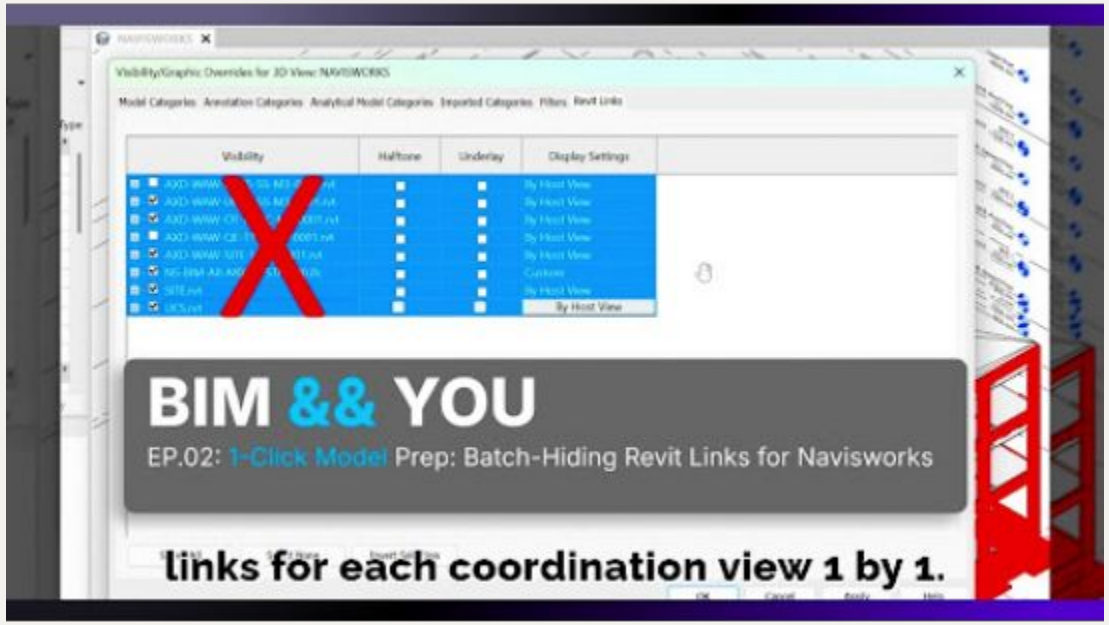

Why Manual Link Hiding Breaks Exports

- Unchecking 10+ RVT and IFC links 1 by 1 wastes valuable coordination hours.

- One missed checkbox exports duplicate linked geometry into Navisworks.

- Repeating Visibility/Graphics overrides across multiple views invites human error.

```
RISK: False clash counts from unhidden
RVT/IFC links.
```

PHASE 02 // ARCHITECTURAL FRAMEWORK

The 3-Stage Automation Logic

01 // INPUT

Target 3D View

Isolate the NAVISWORKS 3D view and query active RVT Links.

→

02 // TRANSFORMATION

Graphic Override

Generate a hide property override with boolean true.

→

03 // OUTPUT

Batch View Hide

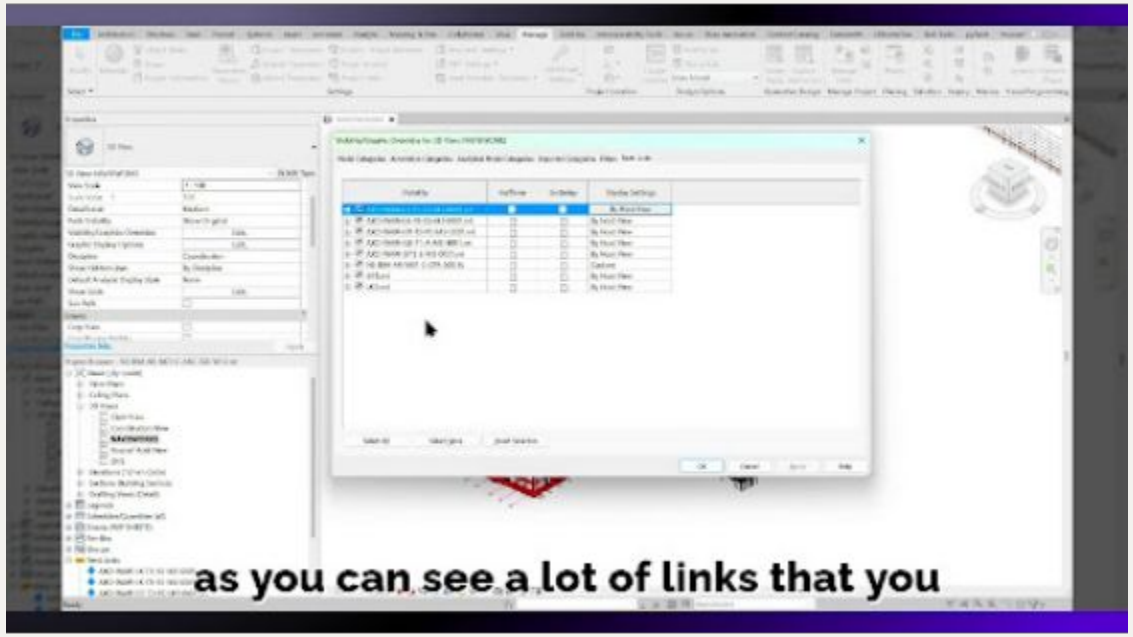

Apply view-specific hide state to every link simultaneously.

CORE DYNAMO STRATEGY // PLAIN ENGLISH

```
Input (NAVISWORKS View + RVT Links) → OverrideGraphicSettings (hide = true) → Element.OverrideInView
```

PHASE 03 // THE SETUP & PREREQUISITES

Model Setup & Dependencies

REQUIRED PARAMETERS & CATEGORIES

`View: "NAVISWORKS" | Category: "RVT Links"`

- Create a dedicated 3D coordination view named NAVISWORKS.

- Keep linked worksets open so Dynamo can detect link instances.

- Uses 100% out-of-the-box Dynamo nodes with zero extra packages.

STEP 01 OF 04 // VIEW SELECTION LOGIC

Filter the Target Coordination View

DYNAMO NODE CLUSTER // GROUP 01: GET COORDINATION VIEW

```
Categories ("3D Views") → All Elements of Category → Element.Name →
String.Contains ("NAVISWORKS") → List.FilterByBoolMask
```

- Collect all 3D views in the project using All Elements of Category.
- Test view names with String.Contains to match your NAVISWORKS view.
- Wire the boolean mask into List.FilterByBoolMask and List.Flatten.

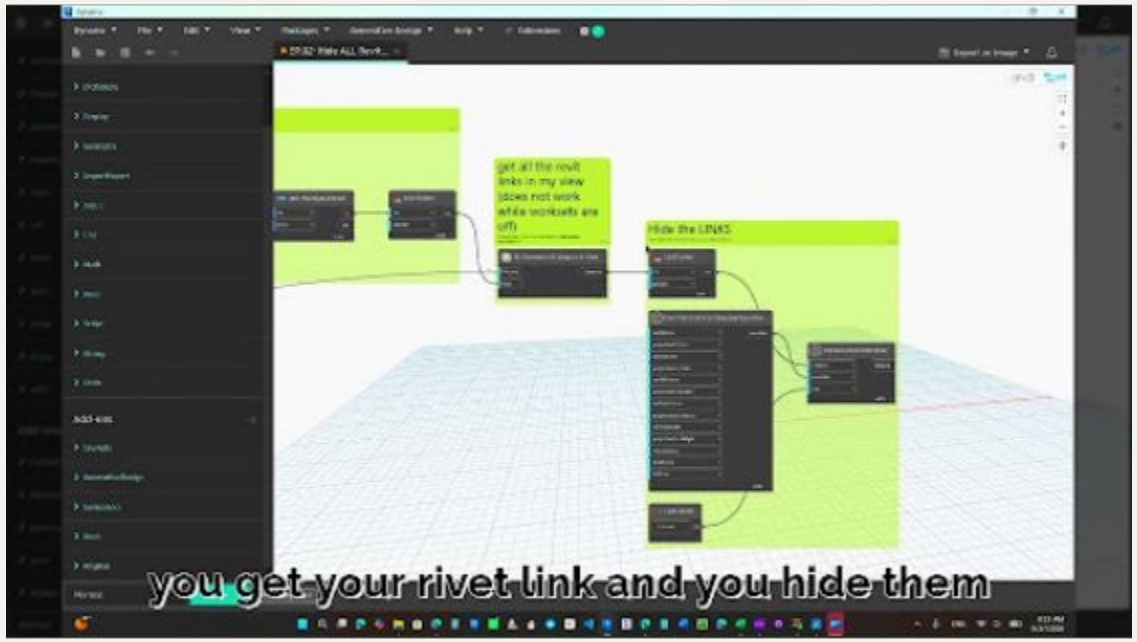

STEP 02 OF 04 // LINK EXTRACTION ENGINE

Query All Revit Links in Target View

ACTIVE NODE CALLOUT

`Category.ByName("RVT Links") → All Elements of Category in View`

- Feed "RVT Links" string into Category.ByName to target link elements.
- Pair category and filtered 3D view inside All Elements of Category in View.
- Note: Node requires linked worksets to be turned ON to retrieve links.

STEP 03 OF 04 // VIEW OVERRIDE EXECUTION

Execute Batch Hide Override in View

DYNAMO NODE CLUSTER // GROUP 04: HIDE THE LINKS

`Code Block (true;) → OverrideGraphicSettings.ByProperties (hide) → Element.OverrideInView`

- Flatten the collected link list with List.Flatten for clean batch processing.
- Wire a true; Code Block into OverrideGraphicSettings.ByProperties hide port.
- Connect element, overrides, and view into Element.OverrideInView.

STEP 04 OF 04 // THE RESULT & COORDINATION ROI

1-Click Run via Dynamo Player

MANUAL PREP

15 Mins

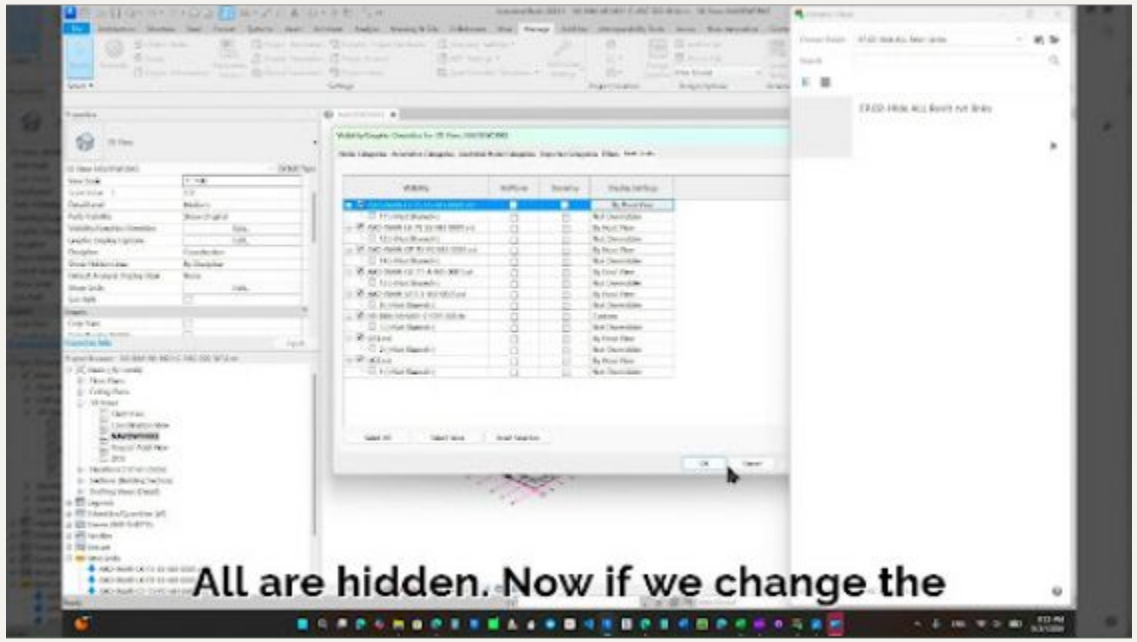

Unchecking links 1 by 1.

DYNAMO PLAYER

1 Second

Instant batch hide run.

- Run EP.02-Hide ALL Revit rvt links directly from Dynamo Player.
- Every RVT and IFC link unchecks automatically for clean Navisworks export.

SAVEABLE REFERENCE // SECOND-MONITOR CHEAT SHEET

5-Point Dynamo Implementation Checklist

STEP	WORKFLOW STAGE	ACTION SUMMARY	PRIMARY DYNAMO NODE
01	Verify Worksets	Confirm all RVT link worksets are open	`Revit Worksets Dialog`
02	Isolate 3D View	Filter 3D views matching NAVISWORKS name	`List.FilterByBoolMask`
03	Call Link Category	Select RVT Links category via string input	`Category.ByName("RVT Links")`
04	Collect View Links	Extract active link elements inside target view	`All Elements of Category in View`
05	Batch Hide Links	Pass hide = true override to all view links	`Element.OverrideInView`

BIM && YOU | EP.02

What Workflow Should I Automate Next?

Stop wasting coordination hours hiding Revit links 1 by 1 before Navisworks exports.
