

BIM & YOU | EP.01: Creating a Coordination View

Automate standard views and eliminate naming inconsistencies with a single Dynamo click.

STEP 1 THE PROBLEM

Tedious Repetition

Manually creating and locking views.

Human Error

Unlocked views getting modified.

STEP 2 THE SETUP

Starting State

Active Revit Model

Required Tool

Dynamo Graph

STEP 3 THE EXECUTION

Target Name

String Node

Execute Script

Click Run

STEP 4 THE RESULT

90% Team Awareness

Standardized view usage.

Focus Restored

Zero repetitive view setups.

THE BOTTLENECK

- **Tedious Repetition:** Manually creating and locking every view across multiple models wastes valuable time.
- **Wasted Processing Time:** Forcing yourself to repeat the exact same setup sequence for each individual Revit model you open.
- **Human Error:** Unlocked views are easily edited by mistake, destroying naming conventions and project standards.

THE APPROACH

Standardize view generation through Dynamo for Revit.

Dynamo Graph Automation

This graph bypasses manual setup by instantly generating locked 3D Navisworks views. It standardizes naming conventions across the project, eliminating human error.

THE PREREQUISITES

Starting State

Active Revit Model

Required Tool

Dynamo Graph

THE EXECUTION

Update the name to your linking, run the script, and check the resulting Revit model.

THE CORE ACTION

String: "NAVISWORKS"

THE IMPACT

90% Team Awareness

Everyone knows exactly which standardized view to use for Navisworks exports, eliminating confusion.

Focus on Coordination

By hitting the run button in Dynamo, you never have to worry about repetitive adjustments. Focus on clashes, not setup.
